

Digitalization and Globalization

Digitalization and Globalization

Cultivation Theory

- a particular narrative is cultivated in one's mind due to long term media exposure, and the person interpret the reality according to media.
- Cultivation theory suggests long-term media exposure shapes perception of reality, while digitalization continues to fundamentally alter democratic processes and global politics. Social media reinforces this impact through confirmation bias and the rapid spread of misinformation, which complicates the distinction between fact and fiction in political discourse.

Aspects:

- Rumors
- Fake news
- conspiracies
- Echo chambers
- confirmation biases

Understanding Globalization:

- borderless world
- Supraterritoriality (where physical borders remain largely irrelevant in terms of social, economic and political activities)
- Cultural capital exchange
- Migration from hard to soft power

Economic Capitalization

- Internationalization of products
- Global capital and trade systems

Cultural Globalization

- Global flow of information and media such as movies, music etc
- Information revolution

Political Globalization

- intergovernmentalism (EU)

Challenges:

- The **2007–09 financial crisis** showed weaknesses in the global capitalist system, too much freedom for banks and financial markets led to economic collapse
- Democratic deficit where governments make decision based on global pressures instead of citizen's needs.
- Globalization can spread the same products, brands, and lifestyles everywhere, creating a **global monoculture** or "**McDonaldization**."
- Critics of globalization argue that it can increase inequality, weaken democracy, threaten local cultures, and damage the environment, making them question whether the current global system is fair and sustainable.
